Please find below and/or attached an Office communication concerning this application or proceeding.

Office Action Summary

Application No.

10/783,417

Applicant(s)

CAROZZI ET AL.

Examiner

Anne R. Kubelik

Art Unit

1638

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☐ Responsive to communication(s) filed on 12 May 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-11, 19, 22 and 23 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11, 19, 22 and 23 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 12 May 2006 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. Claims 1-11, 19 and 22-23 are pending.
2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
3. The objections to claims 2 and 11 are withdrawn in light of Applicant's amendment of the claims.
4. The rejection of claims 22-23 under 35 U.S.C. 102(b) as being anticipated by Barton et al (US Patent 6,833,449, filed August 1989) is withdrawn in light of Applicant's amendment of the claims.

Claim Rejections - 35 USC § 112

5. Claims 1-11, 19 and 22-23 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for nucleic acids encoding SEQ ID NO:2, host cells, plants, plant cells and seeds comprising them, and method of using them to make SEQ ID NO:2, does not reasonably provide enablement for nucleic acids encoding pesticidal protein with 95% identity to SEQ ID NO:2, nucleic acids with 95% identity to SEQ ID NO:1, or a complement of those nucleic acids, host cells, plants, plant cells and seeds comprising them, and method of using them to make a pesticidal protein with 95% identity to SEQ ID NO:2 and a pesticidal protein encoded by a nucleic acid with 95% identity to SEQ ID NO:1. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention commensurate in scope with these claims. The rejection is repeated for the reasons of record as set forth in the Office action mailed 14 February

Art Unit: 1638

2006. Applicant's arguments filed 12 May 2006 have been fully considered but they are not persuasive.

The claims are broadly drawn to nucleic acids encoding a pesticidal protein with 95% identity to SEQ ID NO:2, nucleic acids with 95% identity to SEQ ID NO:1, or a complement of those nucleic acids, host cells, plants, plant cells and seeds comprising them, and method of using them to make a pesticidal protein with 95% identity to SEQ ID NO:2 and a pesticidal protein encoded by a nucleic acid with 95% identity to SEQ ID NO:1.

The instant specification, however, only discusses sequencing of DNAs from non-publically available bacterial strain ATX13026 (examples 1-4), identification of a nucleic acid, SEQ ID NO:1, that encodes a protein, SEQ ID NO:2, with a low percent identity to delta endotoxins (examples 5-6), assay of the protein for pesticidal activity against *Heliothis virescens* (cotton budworm), *Spodoptera frugiperda* (fall army worm), and *Lygus lineolaris* (tarnished plant bug) (examples 7-11), and prophetic guidance for expression in plants (examples 12-14).

The instant specification fails to provide guidance for how to make nucleic acids encoding pesticidal protein with 95% identity to SEQ ID NO:2 and nucleic acids with 95% identity to SEQ ID NO:1.

The instant specification fails to provide guidance for which amino acids of SEQ ID NO:2 can be altered and to which other amino acids, and which amino acids must not be changed, to maintain the activity of the encoded protein. The specification also fails to provide guidance for which amino acids can be deleted and which regions of the protein can tolerate insertions and still produce a functional protein.

Making substitutions in a protein does not produce predictable results. Lazar et al (1988, Mol. Cell. Biol. 8:1247-1252) showed that the “conservative” substitution of glutamic acid for aspartic acid at position 47 reduced biological function of transforming growth factor alpha while “nonconservative” substitutions with alanine or asparagine had no effect (abstract). Similarly, Hill et al (1998, Biochem. Biophys. Res. Comm. 244:573-577) teach that when three histidines that are maintained in ADP-glucose pyrophosphorylase across several species are substituted with the “nonconservative” amino acid glutamine, there is little effect on enzyme activity, while the substitution of one of those histidines with the “conservative” amino acid arginine drastically reduced enzyme activity (see Table 1).

Given the claim breath, unpredictability, and lack of guidance as discussed above, undue experimentation would have been required by one skilled in the art to develop and evaluate nucleic acids encoding proteins with 95% identity to SEQ ID NO:2 or nucleic acids with 95% identity to SEQ ID NO:1. Making all possible single amino acid substitutions in an 735 amino acid long protein like that encoded by SEQ ID NO:1 would require making and analyzing 19^{735} nucleic acids; these proteins would have 99.8%% identity to SEQ ID NO:2. Nucleic acids encoding proteins with 95% identity to SEQ ID NO:2 would encode proteins with 36 amino acid substitutions. Making all possible single nucleotide substitutions in an 2208 nucleic acid like that SEQ ID NO:1 would require making and analyzing 4^{2208} nucleic acids. Nucleic acids with 95% identity to SEQ ID NO:2 encompass those that encode proteins with 110 amino acid substitutions; these proteins would have 85% identity to SEQ ID NO:2. Making all these nucleic acids without guidance as to which amino acid and nucleotide substitutions may be made means that many more than 19^{735} or 4^{2208} nucleic acids would need to be made and analyzed.

Guo et al (2004, Proc. Natl. Acad. Sci. USA 101: 9205-9210) teach that while proteins are fairly tolerant to mutations resulting in single amino acid changes, increasing the number of substitutions additively increases the probability that the protein will be inactivated (pg 9209, right column, paragraph 2). Thus, making and analyzing proteins with up to 110 amino acid substitutions that also have pesticidal activity would require undue experimentation.

Making amino acid substitutions in *cry* proteins is unpredictable. Each *cry* protein only has activity against one or few insect species (de MAAGD et al, 1999, Appl. Environ. Microbiol. 65:4369-4374, see pg 4369, column 1, paragraph 1). Even a single amino acid substitution in a *cry* protein may alter its insecticidal specificity, and toxicity must be determined empirically (Tounsi et al, 2003, J. Appl. Microbiol. 95:23-28; see pg 27, column 2, paragraph 2). For example, a conservative substitution of a lysine for an arginine in a cry11A protein eliminated toxicity to *Aedes aegyptii* (Angsuthanasombat et al, 2001, J. Biochem. Mol. Biol. 34:402-407, paragraph spanning the columns on pg 405).

AXMI-006 has the most similarity to *cry* proteins with toxicity to mosquito (cry4Aa, cry10Aa and cry19Ba; see Ibarra et al, 2003, Appl. Environ. Microbiol. 69:5269-5274; abstract and Table 2). Its toxicity to Lepidopterans *H. virescens* and *S. frugiperda* and the unrelated Euhemipteran *L. lineolaris* suggests that AXMI-006 is a new class of *cry* toxin. Thus, given the novelty of AXMI-006 and the unpredictability making in amino acid substitutions in *cry* proteins, proteins with up to 110 amino acid substitutions relative to SEQ ID NO:2 would likely have a very different insect toxicity than AXMI-006, if such toxins could even be made. The specification does not teach the insect toxicity of such proteins. Therefore, one would not know

Art Unit: 1638

how to use nucleic acids encoding proteins with up to 110 amino acid substitutions relative to SEQ ID NO:2.

The specification fails to teach how to use a complement of nucleic acids encoding pesticidal protein with 95% identity to SEQ ID NO:2 or nucleic acids with 95% identity to SEQ ID NO:1. Complements of DNA molecules are generally used in antisense suppression. Transforming strain ATX13026 with the complement of a nucleic acid encoding a pesticidal protein with 95% identity to SEQ ID NO:2 or a nucleic acid with 95% identity to SEQ ID NO:1 could potentially produce a bacterial strain that does not express the pesticidal protein, but the specification does not teach how to use such a bacterial cell. Transforming the cell of any other organism or transforming a plant with the complement of a nucleic acid encoding a pesticidal protein with 95% identity to SEQ ID NO:2 or a nucleic acid with 95% identity to SEQ ID NO:1, could not suppress the expression of an endogenous protein, as such an endogenous protein would not be present in the cell. The specification does not teach how to use such a cell or plant.

As the specification does not describe the transformation of any plant with a pesticidal protein with 95% identity to SEQ ID NO:2, nucleic acids with 95% identity to SEQ ID NO:1, or a complement of those nucleic acids, undue trial and error experimentation would be required to screen through the myriad of nucleic acids encompassed by the claims and plants transformed therewith, to identify those with insect resistance, if such plants are even obtainable.

Given the claim breadth, unpredictability in the art, undue experimentation, and lack of guidance in the specification as discussed above, the instant invention is not enabled throughout the full scope of the claims.

Applicant urges that specification provides guidance by limiting the percent identity and requiring a function; guidance is provided on pg 8-13 (response pg 11).

This is not found persuasive. The claims encompass nucleic acid that encode proteins up to 110 amino acid substitutions relative to SEQ ID NO:2. Limiting the percent identity of the claimed nucleic acid, requiring a function, and the guidance on pg 8-9 do not teach which amino acid substitutions may be made in the proteins. Guidance for determining percent identity does not teach the necessary and sufficient structural features of the claimed nucleic acids, and does not teach which amino acids could be substitutive with which other amino acids.

Applicant urges that Crickmore (1998) and a webpage teach that numerous δ -endotoxins were known at the time of filing; the molecular biological techniques were routine, and methods of assay are provided in the specification on pg 8 and Examples 7-8 (response pg 11).

This is not found persuasive. Because each *cry* protein only has activity against one or few insect species (de Maagd et al, pg 4369, column 1, paragraph 1), and because Tounsi teaches that even a single amino acid substitution in a *cry* protein may alter its insecticidal specificity (pg 27, column 2, paragraph 2), Crickmore and the specification do not provide guidance as to which 110 amino acid substitutions can be made in SEQ ID NO:2. The webpage could not be considered because a paper copy was not sent.

Further, see *Genentech, Inc. v. Novo Nordisk, A/S*, 42 USPQ2d 1001, 1005 (Fed. Cir. 1997), which teaches that disclosure of a “mere germ of an idea does not constitute [an] enabling disclosure”, and that “the specification, not the knowledge of one skilled in the art” must supply the enabling aspects of the invention.

See also *Amgen Inc. v. Chugai Pharmaceutical Co. Ltd.*, 18 USPQ 2d 1016 at 1027

Art Unit: 1638

... despite extensive statements in the specification concerning all the analogs of the EPO gene that can be made, there is little enabling disclosure of particular analogs and how to make them. Details for preparing only a few EPO analog genes are disclosed. Amgen argues that this is sufficient to support its claims; we disagree. This "disclosure" might well justify a generic claim encompassing these and similar analogs, but it represents inadequate support for Amgen's desire to claim all EPO gene analogs. There may be many other genetic sequences that code for EPO-Type products. Amgen has told how to make and use only a few of them and is therefore not entitled to claim all of them.

Applicant urges that one would only need to make the claimed variants and assay them for activity using routine methods; thus the amount of experimentation is not undue (response pg 11-12).

This is not found persuasive. Doing so would require undue experimentation because the specification does not provide guidance as to which 110 amino acid substitutions can be made in SEQ ID NO:2. Thus, one would need to randomly make nucleic acids encoding proteins with 110 amino acid substitutions and test them. Because this would require trial and error experimentation and because of the likelihood of failure (see Guo et al, pg 9209, right column, paragraph 2), this experimentation would be undue.

Applicant urges that in Lazar and Hill the alteration was designed to occur at a highly conserved amino acid and one would not be surprised that modification would lead to loss of function; furthermore, none of these proteins was a δ -endotoxin (response pg 12-13).

This is not found persuasive. The surprise in Lazar and Hill was that these highly conserved amino acids in these well-characterized proteins did not behave as expected, indicating that the conventional wisdom about using conserved amino acids to guide the making of amino acid substitutions is wrong. Applicant has not shown that δ -endotoxin behave differently from other proteins.

Applicant urges that they have disclosed pesticidal sequences, and fragments and variants thereof, and the art had additional δ -endotoxin sequences; one may align these sequences as described on pg 9-11 to see which areas are unlikely to tolerate mutation (response pg 13).

This is not found persuasive. None of the specificity-altering mutations of DeMaagd, Tounsi and Angsuthanasombat appear to fall within the conserved regions on pg 4 and Fig 1. The specification teaches no variants that do not encode SEQ ID NO:3 or 5.

Applicant urges that Li et al and Morse et al teach detailed information about the structure of δ -endotoxins, which are very well characterized; these could be used to choose among modification to retain the structure of the resultant protein (response pg 13-14).

This is not found persuasive. Li et al do not provide guidance for making 110 amino acid substitutions in a 735 amino acid protein; Li et al only provided guidance for making truncations and insertion of chymotrypsin cleavage sites. Furthermore, the protein taught by Li et al is a cry3Aa protein and that taught by Morse et al is a cry2Aa protein, which the proteins encoded by SEQ ID NO:1 is not. The instant inventors did not use Li et al or Morse et al to make 110 amino acid substitutions in a 735 amino acid protein to create a pesticidal protein.

Applicant urges that Guo teaches the probability that a random amino acid replacement will lead to protein inactivation, while the specification provides a rational method for designing δ -endotoxin variants that retain activity (response pg 14).

This is not found persuasive because given the lack of guidance in the specification for making 110 amino acid substitutions; one would have to make them randomly to make the claimed sequences.

Applicant urges that DeMaagd, Tounsi and Angsuthanasombat describe insertions in conserved regions and domains; further they support Applicant's assertion that one would know which residues would change the function of endotoxins, and thus would know which not to change to maintain function (response pg 15).

This is not found persuasive. First, Li et al teaches that there is no portion of a δ -endotoxin is not part of Domain 1, II or III (¶ spanning pg 815-186); thus, Applicant's arguments that the mutations made in DeMaagd, Tounsi and Angsuthanasombat change the function because they are part of one of these domains would suggest that no mutations could be made in SEQ ID NO:2, and certainly does not provide any guidance for making any nucleic acids with 95% identity to SEQ ID NO:1 and that encode a δ -endotoxin with 110 amino acid substitutions relative to SEQ ID NO:2.

Second, Tounsi teaches that even a single amino acid substitution in a *cry* protein may alter its insecticidal specificity, and toxicity must be determined empirically (pg 27, column 2, paragraph 2).

Further, each *cry* protein only has activity against one or few insect species (de Maagd et al, pg 4369, column 1, paragraph 1). AXMI-006 has the most similarity to *cry* proteins with toxicity to mosquito (*cry*4Aa, *cry*10Aa and *cry*19Ba), but its toxicity to the Lepidopterans *H. virescens* and *S. frugiperda* and the unrelated Euhemipteran *L. lineolaris* suggests that AXMI-014 is a new class of *cry* toxin. Thus, given the novelty of AXMI-006 and the unpredictability making in amino acid substitutions in *cry* proteins, proteins with up to 110 amino acid substitutions relative to SEQ ID NO:2 would likely have a very different insect toxicity than

AXMI-014, if such toxins could even be made. The specification does not teach the insect toxicity of such proteins.

Applicant urges that plant transformation is routine and is taught on pg 20-27 and examples 10-11 (response pg 16).

This is not found persuasive. Making the claimed nucleic acids requires undue experimentation; thus making plants and constructs comprising them requires undue experimentation. The rejection is not that plant transformation and expression cassettes per se requires undue experimentation, but that making the nucleic acid required for the claimed plants and expression cassettes is undue.

6. Claims 1-11, 19 and 22-23 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter that was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. The rejection is repeated for the reasons of record as set forth in the Office action mailed 14 February 2006. Applicant's arguments filed 12 May 2006 have been fully considered but they are not persuasive.

A full review of the specification indicates that nucleic acids encoding a pesticidal protein with 95% identity to SEQ ID NO:2 and nucleic acids with 95% identity to SEQ ID NO:1, wherein the nucleic acid encodes a pesticidal protein are essential to the operation of the claimed invention. As nucleic acids encoding proteins with 95% identity to SEQ ID NO:2 would encode proteins with 36 amino acid substitutions and nucleic acids with 95% identity to SEQ ID NO:2

encompass those that encode proteins with 110 amino acid substitutions, the claims are drawn to a broad genus of nucleic acids. The level of skill and knowledge in the art at the time of filing was such that no other proteins within the scope of the claims were known

The specification describes no relevant characteristics or motifs for the claimed nucleic acids other than identity to SEQ ID NO:1. At the time of filing it was known that each *cry* protein only has activity against one or few insect species (de MAAGD et al, 1999, Appl. Environ. Microbiol. 65:4369-4374, see pg 4369, column 1, paragraph 1) and that even a single amino acid substitution in a *cry* protein may alter its insecticidal specificity (Tounsi et al, 2003, J. Appl. Microbiol. 95:23-28; see pg 27, column 2, paragraph 2), but the relationship between structure and pesticidal function was not known. Furthermore, the specification does not describe the structure required for the recited function, nor does it describe the structural features that distinguish pesticidal protein-encoding nucleic acids with 95% identity to SEQ ID NO:1 from other nucleic acids with 95% identity to SEQ ID NO:1 or pesticidal proteins with 95% identity to SEQ ID NO:2 from other proteins with 95% identity to SEQ ID NO:2.

The only species reduced to practice in the specification is SEQ ID NO:1, which encodes SEQ ID NO:2. Since the disclosure fails to describe the common attributes that identify members of the genus, and because the genus is highly variant, SEQ ID NO:1 alone is insufficient to describe the claimed genus.

Hence, Applicant has not, in fact, described nucleic acids encoding a pesticidal protein with 95% identity to SEQ ID NO:2 and nucleic acids with 95% identity to SEQ ID NO:1, wherein the nucleic acid encodes a pesticidal protein, within the full scope of the claims, and the specification fails to provide an adequate written description of the claimed invention.

Therefore, given the lack of written description in the specification with regard to the structural and functional characteristics of the claimed compositions, it is not clear that Applicant was in possession of the claimed genus at the time this application was filed.

Applicant urges that the claims recite that the nucleic acid has 95% identity to SEQ ID NO:1 a nucleic acid encoding SEQ ID NO:2 and methods of assaying a determining percent identity are known in the art and taught in the specification; further numerous other endotoxins are known in the art, and their structures studied, citing Li et al (response pg).

This is not found persuasive because this recitation does not describe the structural feature responsible for the claimed function.

Applicant urges that they have provided exemplary sequences, variants and fragments, and skilled artisan could envision the claimed sequences (response pg 19).

This is not found persuasive. Neither the exemplary sequences nor the fragments describe the structure of nucleic acids with 95% identity to SEQ ID NO:1 and encoding proteins with 110 amino acid substitutions. No variants encoding proteins with 110 amino acid substitutions are described.

Applicant urges that the specification provides the structural features of nucleic acid that retain pesticidal activity because they recite a percent identity (response pg 19).

This is not found persuasive because not all nucleic acids with 95% identity to SEQ ID NO:1 will encode proteins with pesticidal activity. The specification does not describe the structure required for the recited function, nor does it describe the structural features that distinguish pesticidal protein-encoding nucleic acids with 95% identity to SEQ ID NO:1 from

Art Unit: 1638

other nucleic acids with 95% identity to SEQ ID NO:1 or pesticidal proteins with 95% identity to SEQ ID NO:2 from other proteins with 95% identity to SEQ ID NO:2.

Applicant urges that the claim recites functional characteristics, that is, that they encode proteins with pesticidal activity; the art and the specification provide standard assays for such activity.

This is not found persuasive because the relationship between structure and pesticidal function was not described in the specification.

7. Claim 11 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter that Applicant regards as the invention. The rejection is repeated for the reasons of record as set forth in the Office action mailed 14 February 2006, as applied to claims 3, 11 and 19. Applicant's arguments filed 12 May 2006 have been fully considered but they are not persuasive.

In claim 11, it is not clear if the seed is transgenic because it comprises the vector or if it transgenic because it was transformed with some other nucleic acid.

Applicant urges that claim 11 has been amended to recite "the plant of claim 9; because of dependency the claim now describes seed derived from a plant comprising the nucleic acid of claim 1(response pg).

This is not found persuasive because not all seeds produced from plants comprising the nucleic acid of claim 1 will also corpses that nucleic acid; if the plant has only one copy of the nucleic acid, only half the progeny will comprise the nucleic acid.

Art Unit: 1638

Conclusion

8. **THIS ACTION IS MADE FINAL.** See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Anne Marie Grunberg, can be reached at (571) 272-0975.

The central fax number for official correspondence is (571) 273-8300.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to (571) 272-0547.

Patent applicants with problems or questions regarding electronic images that can be viewed in the Patent Application Information Retrieval system (PAIR) can now contact the USPTO's Patent Electronic Business Center (Patent EBC) for assistance. Representatives are available to answer your questions daily from 6 am to midnight (EST). The toll free number is (866) 217-9197. When calling please have your application serial or patent number, the type of document you are having an image problem with, the number of pages and the specific nature of the problem. The Patent Electronic Business Center will notify applicants of the resolution of the problem within 5-7 business days. Applicants can also check PAIR to confirm that the problem has been corrected. The USPTO's Patent Electronic Business Center is a complete service center supporting all patent business on the Internet. The USPTO's PAIR system provides Internet-based access to patent application status and history information. It also enables applicants to view the scanned images of their own application file folder(s) as well as general patent information available to the public.

For all other customer support, please call the USPTO Call Center (UCC) at 800-786-9199.
